DOCUMENT HISTORY LOG

Status	Document Revision	Approval Date	Description
Interim		09-11-2006	Interim Release
Baseline		07-11-2008	Baseline Release Transitioned Interim Standard NASA-STD-(I)-6016 to NASA Technical Standard NASA-STD-6016.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

FOREWORD

This standard is published by the National Aeronautics and Space Administration (NASA) to provide uniform engineering and technical requirements for processes, procedures, practices, and methods that have been endorsed as standard for NASA programs and projects, including requirements for selection, application, and design criteria of an item.

This standard is approved for use by NASA Headquarters and NASA Centers, including Component Facilities.

This standard defines the minimum requirements for Materials and Processes (M&P) and provides a general control specification for incorporation in NASA program/project hardware procurements and technical programs.

Requests for information, corrections, or additions to this standard should be submitted via “Feedback” in the NASA Technical Standards System at <http://standards.nasa.gov>.

Original Signed By

July 11, 2008

Michael G. Ryschkewitsch
NASA Chief Engineer

Approval Date

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

STANDARD MATERIALS AND PROCESSES REQUIREMENTS FOR SPACECRAFT

1. SCOPE

This document is directed toward materials and processes (M&P) used in the design, fabrication, and testing of flight components for all NASA manned, unmanned, robotic, launch vehicle, lander, in-space and surface systems, and spacecraft program/project hardware elements. All flight hardware is covered by the M&P requirements of this document, including vendor-designed, off-the-shelf, and vendor-furnished items.

M&P used in interfacing ground support equipment (GSE), test equipment, hardware processing equipment, hardware packaging, and hardware shipment shall be controlled to prevent damage to or contamination of flight hardware.

1.1 Purpose

The purpose of this document is to define the minimum requirements for M&P and to provide a general control specification for incorporation in NASA program/project hardware procurements and technical programs.

1.2 Applicability

The controls described here are applicable to all NASA spacecraft programs.

a. Programs shall apply these controls to program/project hardware. Programs, projects, and elements are responsible for flowing requirements down to contractors, subcontractors, and the lowest component-level suppliers.

b. Programs shall be responsible for demonstrating compliance with these requirements.

These requirements may be tailored for specific programs/projects simply by constructing a matrix of applicable paragraphs and paragraphs that are not applicable, subject to approval by the responsible program/project NASA M&P organization, the responsible program/project, and the responsible Technical Authority. Tailoring also includes using existing or previously developed contractor processes and standards as a submittal of the various required plans. Otherwise, the tailoring of requirements may be documented in the Materials and Processes Selection, Control, and Implementation Plan by providing the degree of conformance and the method of implementation for each requirement identified here.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

c. Tailoring of requirements in the Materials and Processes Selection, Control, and Implementation Plan shall be approved by the responsible program/project NASA M&P organization, the responsible project/program, and the responsible Technical Authority. When a contractor Materials and Processes Selection, Control, and Implementation Plan has been approved by the responsible program/project as an acceptable means of compliance with the technical requirements of this document, the plan may be used for the implementation and verification of M&P requirements on the applicable program/project.

This standard may be cited in contract, program, and other Agency documents as a technical requirement. Requirements are indicated by the word “shall”; explanatory/guidance text is indicated in italics in section 4.

2. APPLICABLE DOCUMENTS

2.1 General

The documents listed in this section contain provisions that constitute requirements of this standard as cited in the text of section 4. The applicable documents are accessible via the NASA Technical Standards System at <http://standards.nasa.gov> or may be obtained directly from the Standards Developing Organizations or other document distributors.

3.2 Definitions

Catastrophic Hazard: Hazard that can result in the potential for a disabling or fatal personnel injury, or cause major system destruction.

Corrosive Environment: Solid, liquid, or gaseous environment that deteriorates the materials by reaction with the environment. Clean rooms and vacuum are normally considered noncorrosive.

Critical Hazard: Hazard that can result in the potential for severe injury, severe occupational illness, or major property/equipment damage.

Primary Structure: Principal or main structure that sustains the significant applied loads or provides main load paths for distributing reactions to applied loads and that, if it fails, creates a catastrophic hazard.

Refractory Alloys: Alloys with a melting point above 2000 °C (3632 °F), plus osmium and iridium.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Safety-Critical Hardware: Hardware that, if it fails, creates a critical or catastrophic hazard.

Stress Equalization: A low-temperature heat treatment used to balance stresses in cold-worked material without an appreciable decrease in the mechanical strength produced by cold working.

Structural: Primary load-bearing structure.

Structural Adhesive Bond: Structural joint using adhesive bonds for the purpose of transferring structural load between structures.

Structure: All components and assemblies designed to sustain loads or pressures, provide stiffness and stability, or provide support or containment.

Structure, Primary: That part of a flight vehicle or element that sustains the significant applied loads and provides main load paths for distributing reactions to applied loads. Also the main structure that is required to sustain the significant applied loads, including pressure and thermal loads, and that, if it fails, creates a catastrophic hazard. If a component is small enough and in an environment where no serious threat is imposed if it breaks, then it is not primary structure.

Subcontractor: A hardware contractor that reports to a higher-level contractor.

Technical Authority: The Technical Authority provides technical checks and balances by assuring that safety and mission success, relevant technical standards, engineering work, and safety and reliability analysis products are being conducted properly in accordance with established, high-reliability processes independent of nontechnical program/project constraints.

Useful Life: Total life span including storage life, installed life in a nonoperating mode, and operational service life.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

4. REQUIREMENTS

Requirements for materials used in the fabrication and processing of flight hardware are as follows:

a. Selection shall be by consideration of the worst-case operational requirements for the particular application and the design engineering properties of the candidate materials.

b. The operational requirements shall include, but are not limited to, the following:

- (1) Operational temperature limits.
- (2) Loads.
- (3) Contamination.
- (4) Life expectancy.
- (5) Moisture or other fluid media exposure.
- (6) Vehicle-related induced and natural space environments.

c. Properties that shall be considered in material selection include, but are not limited to, the following:

- (1) Mechanical properties.
- (2) Fracture toughness.
- (3) Flammability and offgassing characteristics.
- (4) Corrosion.
- (5) Stress corrosion.
- (6) Thermal and mechanical fatigue properties.
- (7) Glass-transition temperature.
- (8) Coefficient of thermal expansion mismatch.
- (9) Vacuum outgassing.
- (10) Fluids compatibility.
- (11) Microbial resistance.
- (12) Moisture resistance.
- (13) Fretting.
- (14) Galling.
- (15) Susceptibility to electrostatic discharge (ESD).
- (16) Susceptibility to contamination.

d. Conditions that could contribute to deterioration of hardware in service shall receive special consideration.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

e. Nonflight materials used in processing and testing of flight hardware shall not cause degradation of the flight hardware.

4.1 General Requirements

4.1.1 Materials and Processes Selection, Control, and Implementation Plan

a. Each organization that is responsible for the design and fabrication of spacecraft flight hardware shall provide a Materials and Processes Selection, Control, and Implementation Plan.

b. The Materials and Processes Selection, Control, and Implementation Plan shall document the degree of conformance and method of implementation for each requirement in this standard, identifying applicable in-house specifications used to comply with the requirement.

c. The Materials and Processes Selection, Control, and Implementation Plan shall also describe the methods used to control compliance with these requirements by subcontractors and vendors.

d. The Materials and Processes Selection, Control, and Implementation Plan, upon approval by the procuring activity, shall become the M&P implementation document used for verification.

e. The Materials and Processes Selection, Control, and Implementation Plan shall include what follows in the next sections.

4.1.1.1 Coordination, Approval, and Tracking

The Materials and Processes Selection, Control, and Implementation Plan shall identify the method of coordinating, approving, and tracking all engineering drawings, engineering orders, and other documents that establish or modify materials and/or processes usage.

4.1.1.2 Approval Signature

a. The Materials and Processes Selection, Control, and Implementation Plan shall include a requirement that all design drawings and revisions contain an M&P approval block, or equivalent, to ensure that the design has been reviewed and complies with the intent of this document.

b. Design drawings and revisions shall be signed by the responsible M&P authority prior to release.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.1.1.3 M&P Controls

- a. All M&P shall be defined by standards and specifications.
- b. M&P shall be identified directly on the appropriate engineering drawing.
- c. The Materials and Processes Selection, Control, and Implementation Plan shall identify those M&P standards and specifications used to implement specific requirements in this document.
- d. Standards and specifications shall be selected from government, industry, and company specifications and standards.
- e. Rationale for the selection of company specifications over government and industry voluntary consensus standards and specifications shall be documented in the Materials and Processes Selection, Control, and Implementation Plan.
- f. The rationale for selection of company specifications over government and industry voluntary consensus standards and specifications shall include an identification of government or industry specifications or standards examined and an explanation of why each was unacceptable.
- g. Company M&P specifications shall be identified by document number and revision letter in the Materials and Processes Selection, Control, and Implementation Plan.
- h. All M&P specifications used to produce flight hardware shall be made available to the responsible NASA Program or Project Office and M&P organization.
- i. Changes to M&P standards and specifications identified in the Materials and Processes Selection, Control, and Implementation Plan shall require NASA M&P organization-approved Materials Usage Agreements (MUAs) in accordance with section 4.1.3 of this standard.
- j. Process specifications shall define process steps at a level of detail that ensures a repeatable/controlled process that produces a consistent and reliable product.
- k. Process qualification shall be conducted to demonstrate the repeatability of all processes where the quality of the product cannot be directly verified by subsequent monitoring or measurement.

Small changes to the chemical composition of nonmetallic materials may sometimes occur without affecting the materials specification.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

1. The Materials and Processes Selection, Control, and Implementation Plan shall identify materials where chemical fingerprinting is required to ensure the properties are controlled.

Note: The process requirements in this standard do not provide the detailed process and quality assurance requirements that ensure a process is repeatable. Instead, they are intended as higher level documents that state minimum requirements and provide general directions for the design of hardware.

4.1.1.3.1 Standard and Specification Obsolescence

During a long-term program, M&P standards and specifications identified in this document or in contractor materials control plans could become obsolete. Continued use of obsolete standards and specifications is acceptable for manufacturing series or new-design hardware.

a. Use of an updated, alternate, or new material or process standard or specification from those identified in the Materials and Processes Selection, Control, and Implementation Plan shall be implemented by either of the following means:

- (1) Updating the Materials and Processes Selection, Control, and Implementation Plan upon approval of a meets/exceeds analysis for process standard or specification changes by the responsible NASA M&P organization and program or project office.
- (2) Processing a hardware-specific MUA demonstrating that the revised or alternative standard or specification does not adversely affect the functionality, reliability, and safety of the hardware.

4.1.1.4 Commercial Off-The-Shelf (COTS) Hardware

a. A procedure shall be established to ensure that all vendor-designed, off-the-shelf, and vendor-furnished items are covered by the M&P requirements of this document.

b. The procedure shall include special considerations for off-the-shelf hardware where detailed M&P information may not be available or it may be impractical to impose all the detailed requirements specified in this standard.

c. The procedure shall include provisions for ensuring that this hardware is satisfactory from an overall M&P standpoint.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.1.1.5 M&P Control Board

a. Each hardware provider (excluding subcontractors) shall establish an M&P control board.

b. The M&P control board charter and membership shall be described in the Materials and Processes Selection, Control, and Implementation Plan.

The M&P control board has the responsibility for the planning, management, and coordination of the selection, application, procurement, control, and standardization of M&P for the contract.

The board also has the responsibility for directing and dispositioning M&P problem resolution.

The responsible NASA M&P organization is an active member of the board.

The responsible NASA M&P organization that is also an active member of the board has the right of disapproval of board decisions.

4.1.2 M&P Usage Documentation

a. M&P usage shall be documented in an electronic searchable parts list or separate electronic searchable Materials Identification and Usage List (MIUL).

b. The procedures and formats for documentation of M&P usage depends upon specific hardware but shall cover the final design as delivered.

c. The system used shall be an integral part of the engineering configuration control/release system.

4.1.2.1 Human-Rated Spacecraft

For human-rated spacecraft, a copy of the stored data shall be provided to NASA in a form compatible with the Materials and Processes Technical Information System (MAPTIS).

MAPTIS is accessible via the Internet at <http://maptis.nasa.gov>.

Note: Accessibility to MAPTIS is by registration only.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.1.2.2 Non-Human-Rated Spacecraft

For non-human-rated spacecraft, the program/project shall define the MIUL documentation approach in the Materials and Processes Selection, Control, and Implementation Plan.

4.1.2.3 MIUL Content

- a. The parts list, or MIUL, shall identify the following applicable information:
 - (1) Detail drawing and dash number.
 - (2) Next assembly and dash number.
 - (3) Change letter designation.
 - (4) Drawing source.
 - (5) Material form.
 - (6) Material manufacturer.
 - (7) Material manufacturer's designation.
 - (8) Material specification.
 - (9) Process specification.
 - (10) Environment.
 - (11) Weight (nonmetallic materials).
 - (12) MAPTIS material code (if data are to be provided in a form compatible with MAPTIS).
 - (13) Standard/commercial part number.
 - (14) Contractor.
 - (15) System.
 - (16) Subsystem.
 - (17) Maximum operating temperature.
 - (18) Minimum operating temperature.
 - (19) Fluid type.
 - (20) Surface area (nonmetallic materials).
 - (21) Associate contractor number.
 - (22) Project.
 - (23) Document title.
 - (24) Criticality.
 - (25) Line number.
 - (26) Overall evaluation.
 - (27) Overall configuration test.
 - (28) Maximum operating pressure.
 - (29) Minimum operating pressure.
 - (30) MUA number or rationale code.
 - (31) Cure codes.
 - (32) Materials rating.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

(33) Remarks (comments field).

- b. MAPTIS shall be consulted to obtain material codes and ratings for materials, standard and commercial parts, and components.
- c. New material codes shall be assigned by NASA's Marshall Space Flight Center (MSFC).
- d. Where batch/lot testing is required, traceability of specific test reports for batch/lot used shall be provided in the remarks field.
- e. Wire, cable, and exposed surfaces of connectors shall meet the requirements of this document and be reported on the MIUL.
- f. All other standard and nonstandard Electrical, Electronic, and Electromechanical (EEE) parts shall be exempt from these requirements and reporting on the MIUL.

Materials used in hermetically sealed electronic containers (maximum leak rate less than $1 \times 10^{-4} \text{ cm}^3/\text{sec}$) are exempt from inclusion in the MIUL.

4.1.3 MUAs

The use of M&P that do not comply with the requirements of this standard may still be acceptable in the actual hardware applications.

- a. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.
- b. The MUA shall include sufficient information to demonstrate that the application is technically acceptable.
- c. MUAs shall not be used to change the M&P requirements for a nonconforming product.

When the nonconformance is a deviation from M&P requirements and is acceptable for future series hardware, an MUA may be generated to provide technical support for a change to the product baseline. If MUA approval is not granted, a waiver request may be submitted per the program/project Configuration Management Control Plan.

A typical MUA form is given in Appendix A.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

4.1.3.1 Human-Rated Spacecraft

For human-rated spacecraft, a tiered MUA system with three categories shall be used.

4.1.3.1.1 Category I MUAs

Category I MUAs are those that involve M&P usage that could affect the safety of the mission, crew, or vehicle or affect the mission success, but must be used for functional reasons.

Category I MUAs are delivered by the hardware developer, and approval by the responsible NASA M&P organization and the NASA Program/Project Office shall be required.

4.1.3.1.2 Category II MUAs

Category II MUAs are those that involve M&P usage that fails a screening of M&P requirements and is not considered a hazard in its use application but for which no Category III rationale code exists.

Category II MUAs are delivered by the hardware developer, and approval by the responsible NASA M&P organization shall be required.

4.1.3.1.3 Category III MUAs

Category III MUAs are those that involve M&P that have not been shown to meet these requirements but have an approved rationale code listed in Appendix B. They are evaluated and determined to be acceptable at the configuration/part level.

Approved category III MUAs shall be reported in the MIUL system or electronic data system utilizing the approved rationale codes in Appendix B.

Category III MUAs are approved by the hardware developer and responsible M&P organization through acceptance of the MIUL. A key may be provided to correlate contractor Category III MUA database codes to the codes in Appendix B. No MUA form is submitted.

4.1.3.2 Non-Human-Rated Spacecraft

For nonhuman-rated spacecraft, the MUA system shall be defined in the Materials and Processes Selection, Control, and Implementation Plan as approved in accordance with paragraph 1.2.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

4.1.4 Manufacturing Planning

a. M&P organizations shall participate in manufacturing planning to ensure compliance with M&P requirements.

b. The degree of M&P involvement in manufacturing planning shall be defined in the Materials and Processes Selection, Control, and Implementation Plan described in paragraph 4.1.1 of this standard.

4.1.5 Materials Certification and Traceability

a. All parts or materials shall be certified as to composition, properties, and requirements as identified by the procuring document.

b. Parts and materials used in critical applications, such as life-limited materials and/or safety- and fracture-critical parts, shall be traceable through all processing steps defined in the engineering drawing to the end-item application.

c. Processing records shall be retained for the life of the program.

4.1.6 Material Design Allowables

a. Values for allowable mechanical properties of structural materials (A, B, or S) in their design environment shall be taken from MMPDS, Metallic Materials Properties Development and Standardization, or MIL-HDBK-17-2, -4, and -5.

b. When high-strength metallic materials are heat treated, the adequacy of the heat treatment process shall be verified by test (see section 4.2.2 of this standard).

Note: Values for allowable mechanical properties of structural materials listed in later versions of MMPDS than that specified in section 2 may be used, provided the methodology used to develop the allowable mechanical properties is at least as conservative.

c. Material “B” allowable values shall not be used except in redundant structure in which the failure of a component would result in a safe redistribution of applied loads to other load-carrying members.

d. Material “S” allowables **not listed in MMPDS or MIL-HDBK-17 shall not be used** in primary structure or fracture-critical hardware without an approved MUA to document that the “S” allowables have been properly derived in accordance with the procedures in MMPDS or MIL-HDBK-17.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Material “S” allowables developed with this methodology may be used in noncritical applications without an MUA.

e. When design allowables for mechanical properties of new or existing structural materials are not available, they shall be determined by analytical methods described in MMPDS or MIL-HDBK-17-1, -3, -4, and -5.

f. The hardware developer shall develop a plan describing its philosophy on how it will determine what material design properties will be used; and if those properties do not exist, how they will be developed including, but not limited to, the statistical approaches to be employed.

g. All mechanical and physical property data shall be provided to the responsible NASA M&P organization.

4.2 Detailed Requirements

4.2.1 Flammability, Offgassing, and Compatibility Requirements

Materials shall meet the requirements of NASA-STD-(I)-6001, Flammability, Offgassing, and Compatibility Requirements and Test Procedures, as described below.

4.2.1.1 Flammability Control

a. Materials that are nonflammable or self-extinguishing in their use configuration as defined by NASA-STD-(I)-6001, Test 1 or Test 10, shall be used for flammability control.

Material flammability ratings and tests based on NASA-STD-(I)-6001 for many materials are found in the MAPTIS database.

b. Additional acceptable materials or methods are the following:

- (1) The use of ceramics, metal oxides, and inorganic glasses shall be accepted without test.

When a material is sufficiently chemically and physically similar to a material found to be acceptable by testing per NASA-STD-(I)-6001, the use of this material without testing may be justified on an approved MUA.

- (2) Materials tested and self-extinguishing per NASA-STD-(I)-6001 under more severe conditions with respect to the use environment shall be acceptable without test, as in the following examples:

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- (a) Materials used in an environment with an oxygen concentration lower than the test level are accepted without test (provided that the oxygen partial pressure is not substantially greater than the partial pressure at the test level) whereas materials used in an environment where the concentration is greater than the test level shall be tested or considered flammable by default.
- (b) If a material passes the flammability test on a metal substrate, it shall be used on metal substrates of the same thickness or greater.
- (c) If the material is used on a thinner or nonheat-sinking substrate (or on no substrate at all), it shall be retested or considered flammable by default.

Materials that are considered flammable by default may still be accepted through the MUA approval process.

Many situations arise where flammable materials are used in an acceptable manner without test, using mitigation practices and the MUA approval system. Guidelines for hardware flammability assessment and mitigation can be found in JSC 29353, Flammability Configuration Analysis for Spacecraft Applications.

4.2.1.2 Toxic Offgassing

a. All materials used in habitable flight compartments shall meet the offgassing requirements of Test 7 of NASA-STD-(I)-6001.

Offgassing testing is not required for metallic materials or for ceramics and metal oxides.

b. Spacecraft Maximum Allowable Concentration (SMAC) values shall be obtained from JSC 20584, Spacecraft Maximum Allowable Concentrations for Airborne Contaminants.

c. For compounds for which no SMAC values are found in JSC 20584, the values in MAPTIS shall be used.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.1.3 Fluid Compatibility (Fluids Other Than Oxygen)

- a. Materials exposed to hazardous fluids¹ shall be evaluated or tested for compatibility.

NASA-STD-(I)-6001, Test 15, is a screening test for short-term exposure to fuels and oxidizers.

- b. Appropriate long-term tests shall be conducted for materials with long-term exposure to fuels, oxidizers, and other hazardous fluids.

- c. The test conditions shall simulate the worst-case use environment that would enhance reactions or degradation of the material or fluid.

- d. Materials degradation in long-term tests shall be characterized by post-test analyses of the material and fluid to determine the extent of changes in chemical and physical characteristics, including mechanical properties.

- e. The effect of material condition (for example, parent versus weld metal or heat-affected zone) shall be addressed in the compatibility determination.

4.2.1.4 Oxygen Compatibility

- a. Liquid and gaseous oxygen (LOX/GOX) systems shall use materials that are nonflammable in their worst-case use configuration, as defined by NASA-STD-(I)-6001, Test 17, for upward flammability in GOX (or Test 1 for materials used in oxygen pressures that are less than 50 psia (350 kPa)).

Material flammability ratings and tests based on NASA-STD-(I)-6001 for many materials are found in the MAPTIS database.

- b. When a material in an oxygen system is determined to be flammable by this test, an oxygen compatibility assessment shall be conducted as described in NASA-STD-(I)-6001.

- c. The system safety rationale of this assessment shall be documented in an MUA.

- d. When the oxygen compatibility assessment shows the risk is above an acceptable level, then configurational testing shall be conducted to support the compatibility assessment.

¹ For the purpose of this standard, the definition of hazardous fluids includes gaseous oxygen, liquid oxygen, fuels, oxidizers, and other fluids that could cause corrosion, chemically or physically degrade materials in the system, or cause an exothermic reaction.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

e. The configurational testing shall exercise the ignition mechanism in question using an accepted test method.

f. The configurational test method and acceptance criteria shall be reviewed and approved as part of the MUA process described in paragraph 4.1.3.

g. The as-built configuration shall be verified against the compatibility assessment to ensure that mitigation methods identified in the report were incorporated into the final hardware design and build.

h. For compressed air systems and pressurized systems containing enriched oxygen, the need for an oxygen compatibility assessment shall be addressed in the Materials and Processes Selection, Control, and Implementation Plan.

Compressed air systems and pressurized systems containing enriched oxygen are inherently less hazardous than systems containing pure oxygen; the hazard increases with oxygen concentration and pressure.

Guidelines on the design of safe oxygen systems are contained in ASTM MNL 36, Safe Use of Oxygen and Oxygen Systems: Handbook for Design, Operation, and Maintenance; ASTM G88, Standard Guide for Designing Systems for Oxygen Service; ASTM G63, Standard Guide for Evaluating Nonmetallic Materials for Oxygen Service; ASTM G94, Standard Guide for Evaluating Metals for Oxygen Service; and NASA/TM-2007-213740, Guide for Oxygen Compatibility Assessments on Oxygen Components and Systems.

4.2.1.4.1 Oxygen Component Acceptance Test

a. Oxygen and enriched air system components that operate at pressures above 1.83 MPa (265 psia) shall undergo oxygen compatibility acceptance testing at maximum design pressure for a minimum of ten cycles to ensure that all oxygen system flight hardware is exposed to oxygen prior to launch.

b. Components shall be retested if post-test actions (such as rework, repair, or interfacing with hardware having uncontrolled cleanliness) invalidate the acceptance test.

4.2.1.5 Electrical Wire Insulation Materials

a. Electrical wire insulation materials shall be evaluated for flammability in accordance with NASA-STD-(I)-6001, Test 4.

b. Arc tracking shall be evaluated in accordance with NASA-STD-(I)-6001, Test 18.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Arc tracking testing is not required for polytetrafluoroethylene (PTFE), PTFE laminate, ethylene tetrafluoroethylene (ETFE), or silicone-insulated wires since the resistance of these materials to arc tracking has already been established.

4.2.2 Metals

MSFC-STD-3029, Guidelines for the Selection of Metallic Materials for Stress Corrosion Cracking Resistance in Sodium Chloride Environments, shall be used to select metallic materials to control stress corrosion cracking of metallic materials in sea and air environments.

Additional information regarding metallic materials can be found in MAPTIS.

Note: When released, NASA-STD-6004, Selection of Metallic Materials for Stress Corrosion Cracking Resistance, may be used in place of MSFC-STD-3029.

4.2.2.1 Aluminum

- a. Aluminum alloys used in structural applications shall be resistant to general corrosion, pitting, intergranular corrosion, and stress corrosion cracking.
- b. 5000-series alloys containing more than 3 percent magnesium shall not be used in applications where the temperature exceeds 66 °C (150 °F), because grain boundary precipitation above this temperature can create stress-corrosion sensitivity.
- c. Heat treatment of aluminum alloy parts shall meet the requirements of SAE-AMS 2772, Heat Treatment of Aluminum Alloy Raw Materials, SAE-AMS 2770, Heat Treatment of Wrought Aluminum Alloy Parts, or SAE-AMS 2771, Heat Treatment of Aluminum Alloy Castings.
- d. When aluminum alloys are solution heat-treated, process-control tensile-test coupons shall be taken from the production part (or from the same material lot and processed identically to the production part) to verify the adequacy of the heat treatment process.
- e. The requirement for process control coupons shall be specified on the engineering drawing for the part.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.2.2 Steel

Carbon and low alloy steels heat-treated to strength levels at or above 1240 MPa (180 ksi) ultimate tensile strength (UTS) are sensitive to stress corrosion and shall not be used without an approved MUA.

Note: Many applications are covered by Category III MUA rationale code 506 (see Appendix B).

4.2.2.2.1 Heat Treatment of Steels

a. Steel parts shall be heat-treated to meet the requirements of SAE-AMS-H-6875, Heat Treatment of Steel Raw Materials, or SAE-AMS 2759, Heat Treatment of Steel Parts, General Requirements.

b. When high-strength steels (>200 ksi (1380 MPa) UTS), tool steels, and maraging steel alloys are heat-treated to high strength levels, process-control tensile-test coupons shall be taken from the production part (or from the same material lot and processed identically to the production part) to verify the adequacy of the heat treatment process.

- (1) The requirement for process control coupons shall be specified on the engineering drawing for the part.
- (2) For all other steels (including alloy steels), the adequacy of the heat treatment process shall be verified by hardness measurements.
- (3) Hardenability limits of low alloy steels shall be taken into consideration when design is constrained by part size and uniformity of material mechanical properties.

c. When acid cleaning baths or plating processes are used, the part shall be baked in accordance with SAE-AMS 2759/9, Hydrogen Embrittlement Relief (Baking) of Steel Parts, to alleviate potential hydrogen embrittlement problems.

4.2.2.2.2 Drilling and Grinding of High Strength Steel

a. The drilling of holes, including beveling and spot facing, in martensitic steel hardened to 1340 MPa (180 ksi) UTS or above, shall be avoided.

b. When such drilling, machining, reaming, or grinding is unavoidable, carbide-tipped tooling and other techniques necessary to avoid formation of untempered martensite shall be used.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- c. Micro-hardness and metallurgical examination of test specimens typical of the part shall be used to verify that martensite areas have not been formed as a result of drilling or grinding operations, or temper etch actual hardware in lieu of destructive test.
- d. The edges of the drilled holes shall be deburred by a method that has been demonstrated not to cause untempered martensite.
- e. The surface roughness of finished holes shall not be greater than 63 roughness-height ratio.

4.2.2.2.3 Corrosion Resistant Steel

- a. Unstabilized, austenitic steels shall not be used above 371 °C (700 °F).
- b. Welded assemblies shall be solution heat-treated and quenched after welding except for the stabilized or low carbon grades such as 321, 347, 316L, and 304L.
- c. Service-related corrosion issues are common for free-machining alloys such as 303, and these alloys shall not be used in applications where they can get wet.

4.2.2.3 Titanium

4.2.2.3.1 Heat Treatment

- a. Heat treatment of titanium and titanium alloy parts shall meet the requirements of SAE-AMS-H-81200, Heat Treatment of Titanium and Titanium Alloys.
- b. When titanium alloys are heat treated, process-control tensile-test coupons shall be taken from the production part (or from the same material lot and processed identically to the production part) to verify the adequacy of the heat treatment process.
- c. The requirement for process control coupons shall be specified on the engineering drawing for the part.

4.2.2.3.2 Titanium Contamination

- a. All cleaning fluids and other chemicals used during manufacturing and processing of titanium hardware shall be verified to be compatible and not detrimental to performance before use.

Hydrochloric acid, chlorinated solvents, chlorinated cutting fluids, fluorinated hydrocarbons, and anhydrous methyl alcohol can all produce stress corrosion cracking. Mercury, cadmium, silver, and gold have been shown to cause liquid-metal-induced embrittlement and/or solid-metal-induced embrittlement in titanium and its alloys. Liquid-metal-induced embrittlement of

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

titanium alloys by cadmium can occur as low as 149 °C (300 °F), and solid-metal-induced embrittlement of titanium alloys by cadmium can occur as low as room temperature.

b. The surfaces of titanium and titanium alloy mill products shall be 100 percent machined, chemically milled, or pickled to a sufficient depth to remove all contaminated zones and layers formed while the material was at elevated temperature.

Contaminated zones and layers may be formed as a result of mill processing, heat treating, and elevated temperature-forming operations.

4.2.2.3.3 Titanium Wear

Titanium and its alloys exhibit very poor resistance to wear. Fretting that occurs at interfaces with titanium and its alloys has often contributed to crack initiation, especially fatigue initiation. The preferred policy is a design that avoids fretting and/or wear with titanium and its alloys.

If fretting and/or wear is unavoidable, the subject region shall be anodized per SAE-AMS 2488, Anodic Treatment – Titanium and Titanium Alloys Solution, pH 13 or Higher, or hard-coated utilizing a wear-resistance material such as tungsten carbide/cobalt thermal spray.

4.2.2.3.4 Titanium Welding

a. Titanium and its alloys shall be welded with alloy-matching fillers or autogenously.

b. Extra Low Interstitial (ELI) filler wires shall be used for cryogenic applications and are preferred for general applications.

c. Commercially Pure (CP) titanium filler shall not be used on 6-4 titanium or other alloyed base material; hydride formation can occur in the weld, which can produce a brittle, catastrophic failure.

d. Nitrogen, hydrogen, carbon dioxide, and mixtures containing these gases shall not be used in welding titanium and its alloys.

A great deal of care needs to be exercised to ensure complete inert gas (argon or helium) coverage during welding.

(1) The inert gas shall have a dew point of -60° C (-76° F) or lower.

e. Welded alpha and alpha-plus-beta alloys shall be stress relieved in a vacuum or inert gas environment (Ar or He).

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

f. Beta alloys that are welded shall be evaluated on a case-by-case basis with respect to stress relief.

4.2.2.3.5 Titanium Flammability

a. Titanium alloys shall not be used with LOX or GOX at any pressure or with air at oxygen partial pressures above 35 kPa (5 psia).

b. Titanium alloys shall not be machined inside spacecraft modules during ground processing or in flight, because machining operations can ignite titanium turnings and cause fire.

4.2.2.4 Magnesium

a. Magnesium alloys shall not be used except in areas where minimal exposure to corrosive environments can be expected and protection systems can be maintained with ease and high reliability.

b. Magnesium alloys shall not be used in primary structure or in other areas subject to wear, abuse, foreign object damage, abrasion, erosion, or at any location where fluid or moisture entrapment is possible.

c. Magnesium alloys shall not be machined inside spacecraft modules during ground processing or in flight, because machining operations can ignite magnesium turnings and cause fire.

4.2.2.5 Beryllium

a. Beryllium shall not be used for primary structural applications.

Beryllium is allowed as an alloying constituent up to 4 percent by weight.

b. Beryllium alloys containing more than 4 percent beryllium by weight shall not be used for any application within spacecraft crew compartments unless suitably protected to prevent erosion or formation of salts or oxides.

c. Design of beryllium parts shall include consideration of its low-impact resistance and notch sensitivity, particularly at low temperatures, and its directional material properties (anisotropy) and sensitivity to surface finish requirements.

d. All beryllium parts shall be processed to ensure complete removal of the damaged layer (twins and microcracks) produced by surface-metal-working operations such as machining and grinding.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Chemical/milling and etching are recognized successful processes for removal of the damaged layer.

e. Beryllium alloys and oxides of beryllium shall not be machined inside spacecraft crew compartments at any stage of manufacturing, assembly, testing, modification, or operation.

f. All beryllium parts shall be penetrant-inspected for crack-like flaws with a high-sensitivity fluorescent dye penetrant in accordance with section 4.2.5.

4.2.2.6 Cadmium

a. Cadmium shall not be used in crew or vacuum environments.

b. Cadmium-plated tools shall not be used in the manufacture of flight hardware.

4.2.2.7 Zinc

a. Zinc shall not be used in vacuum environments where the temperature/pressure environment could cause contamination of optical surfaces or electrical devices.

b. Owing to zinc's ability to grow whiskers, zinc plating shall not be used.

4.2.2.8 Mercury

a. Owing to its potential for causing liquid-metal embrittlement, equipment containing mercury shall not be used where the mercury could come in contact with the spacecraft or spaceflight equipment during manufacturing, assembly, test, checkout, and flight.

b. Flight hardware (including fluorescent lamps) containing mercury shall have three levels of containment to prevent mercury leakage.

c. The bulbs of nonflight lamps containing mercury, such as those used in hardware ground processing and fluorescent dye penetrant inspection of flight parts, shall be protected by a nonshatterable, leak-proof outer container.

4.2.2.9 Refractory Metals

a. Since engineering data on refractory alloys (alloys with a melting point above 2000 °C (3600 °F), plus osmium and iridium) are limited, especially under extreme environmental conditions of spacecraft, an MUA shall be required for all applications of such alloys.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

b. Appropriate tests shall be performed to characterize the material for the intended application and the data documented in the MUA.

4.2.2.10 Superalloys (Nickel-Based and Cobalt-Based)

a. High-nickel content alloys are susceptible to sulfur embrittlement; therefore, any foreign material which could contain sulfur, such as oils, grease, and cutting lubricants, shall be removed by suitable means prior to heat treatment, welding, or high temperature service.

Some of the precipitation-hardening superalloys are susceptible to alloying element depletion at the surface in a high temperature, oxidizing environment.

b. The effect of alloying element depletion at the surface in a high temperature, oxidizing environment shall be carefully evaluated when a thin sheet of one of these alloys is used, since a slight amount of depletion could involve a considerable proportion of the effective cross section of the material.

4.2.2.10.1 Heat Treatment of Nickel- and Cobalt-Based Alloys

a. Heat treatment of nickel- and cobalt-based alloy parts shall meet the requirements of SAE-AMS 2774, Heat Treatment, Wrought Nickel Alloy and Cobalt Alloy Parts.

b. When nickel- and cobalt-based alloys are work strengthened before age hardening, resulting in age-hardened tensile strengths greater than 1030 MPa (150 ksi) UTS, process-control tensile-test coupons shall be taken from the production part (or from the same material lot and processed identically to the production part) to verify the adequacy of the heat treatment process.

c. The requirement for process control coupons shall be specified on the engineering drawing for the part.

d. When tensile test coupons are not required, the adequacy of the heat treatment process shall be verified by hardness measurements.

4.2.2.11 Tin

a. Tin and tin plating shall not be used in any applications unless the tin is alloyed with at least 3 percent lead to prevent tin whisker growth.

b. The presence of at least 3 percent lead shall be verified by lot sampling.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.3 Nonmetallic Materials

4.2.3.1 Elastomeric Materials

- a. Elastomeric materials shall be selected to operate within design parameters for the life of the vehicle after a storage time of 5 years.
- b. Elastomeric materials shall be cure-dated for tracking purposes.
- c. Room Temperature Vulcanizing (RTV) silicones that liberate acetic acid during cure shall not be used since they can cause corrosion.
- d. When rubbers or elastomers are used at low temperatures, the ability of these materials to maintain and provide required elastomeric properties shall be verified.
- e. Natural rubber materials shall not be used.

4.2.3.2 Polyvinylchloride

- a. Use of polyvinylchloride on flight hardware shall be limited to applications in pressurized areas where temperatures do not exceed 49 °C (120 °F).
- b. Polyvinylchloride shall not be used in a vacuum.

4.2.3.3 Composite Materials

- a. Materials used in composite structures shall be developed and qualified in accordance with the methods in MIL-HDBK-17-1, -2, -3, -4, and -5.
- b. Material property design allowables for composites shall be developed using the methodology described in MIL-HDBK-17-1, -2, -3, -4, and -5.

4.2.3.4 Lubricants

- a. NASA-TM-86556, Lubrication Handbook For the Space Industry, Part A: Solid Lubricants, Part B: Liquid Lubricants, shall be used in the evaluation and selection of lubricants for space flight systems and components.

Lubricants are not restricted to those listed in NASA-TM-86556; guidelines on additional lubricants are contained in NASA/CR-2005-213424, Lubrication for Space Applications.

- b. Long-life performance shall be considered in lubricant selection.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

c. Lubricants containing chloro-fluoro components shall not be used with aluminum or magnesium if shear stresses can be imposed.

d. Hardware with lubricants containing chloro-fluoro components shall not be heated above the maximum rated temperature of the lubricant, because decomposition/reaction products can attack metallic materials.

4.2.3.5 Limited-Life Items

a. All materials shall be selected to meet the useful life (to include storage life, installed life in a nonoperating mode, and operational service life) of the hardware with no maintenance.

b. Materials that are not expected to meet the design life requirements but must be used for functional reasons shall be identified as limited-life items, requiring maintainability.

4.2.3.6 Thermal Vacuum Stability

a. Nonmetallic materials that are exposed to space vacuum shall be tested using the technique of ASTM-E595, Total Mass Loss and Collected Volatile Condensable Materials From Outgassing in a Vacuum Environment, Standard Test Method for, with acceptance criteria of ≤ 0.1 percent collected volatile condensable materials (CVCM) and ≤ 1.0 percent total mass loss (TML).

A TML greater than 1.0 percent is permitted if this mass loss has no effect on the functionality of the material itself and no effect on the functionality of any materials, components, or systems that could be adversely affected by the subject mass loss.

b. Materials that are line of sight to contamination-sensitive surfaces on the spacecraft or attached vehicles shall have a ≤ 0.01 percent CVCM.

Contamination-sensitive surfaces include windows, lenses, star trackers, solar arrays, radiators, and other surfaces with highly controlled optical properties.

c. Hardware items (components, assemblies, etc.) containing materials that fail the CVCM requirement and/or having unidentified materials, shall be vacuum baked at a temperature of 125 °C (257 °F) until the outgassing condensation rate, as measured by a quartz crystal microbalance at 25 °C (77 °F), is less than 1×10^{-9} g cm⁻² s⁻¹.

When a vacuum-bake temperature of 125 °C (257 °F) could damage flight hardware, lower temperatures may be used with an approved MUA.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- (1) The test chamber shall be verified to have a background outgassing condensation rate less than $6 \times 10^{-10} \text{ g cm}^{-2} \text{ s}^{-1}$ before hardware exposure, and the test pressure shall be less than 5×10^{-5} torr.
- (2) A hardware functionality bench test shall be performed to re-verify performance after baking.

4.2.3.7 External Environment Survivability

- a. Materials exposed in the spacecraft external environment shall be selected to perform in that environment for their intended life-cycle exposure.
- b. The critical properties of the material shall survive exposure to the environments of atomic oxygen, solar ultraviolet (UV) radiation, ionizing radiation, plasma, vacuum, thermal cycling, and contamination.
- c. Critical properties shall survive exposure to applicable planetary environments, such as dust and planetary atmospheres.
- d. Meteoroids and orbital debris shall also be considered in the analysis of long-term degradation.

4.2.3.8 Fungus Resistance

- a. Organic materials used in the pressurized environment shall be evaluated for fungus resistance prior to selection and qualification.
- b. Materials that are nonnutrient to fungi shall be used, as identified in MIL-HDBK-454, General Guidelines for Electronic Equipment, Requirement 4, Fungus-Inert Materials, Table 4-I, Group I, except when one of the following criteria is met:
 - (1) Materials have been tested to demonstrate acceptability per MIL-STD-810, Department of Defense Test Method Standard for Environmental Engineering Considerations and Laboratory Tests, Method 508.
 - (2) Materials are used in crew areas, where fungus would be visible and easily removed.
 - (3) Materials are used inside environmentally sealed containers with internal container humidity less than 60 percent relative humidity (RH) at ambient conditions.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- (4) Materials are used inside electrical boxes where the temperature is always greater than or equal to the ambient cabin temperature.
 - (5) Materials have edge exposure only.
 - (6) Materials are normally stowed with no risk of condensation in stowage locations.
 - (7) Materials are used on noncritical, off-the-shelf electrical/electronic hardware that is stowed and/or used in crew areas.
 - (8) Materials are fluorocarbon polymers (including ETFE) or silicones.
 - (9) Materials are used in crew clothing items.
- c. When fungus-nutrient materials shall be used, they shall be treated to prevent fungus growth.
 - d. Materials not meeting this requirement shall be identified including any action required such as inspection, maintenance, or replacement periods.
 - e. Fungus treatment shall not adversely affect unit performance or service life or constitute a health hazard to higher order life.
 - f. Materials so treated shall be protected from environments that would be sufficient to leach out the protective agent.

4.2.3.9 Glycols

- a. When solutions containing ethylene or propylene glycol are used aboard spacecraft that have electrical or electronic circuits containing silver or silver-coated copper, a silver chelating agent such as benzotriazole (BZT) shall be added to the solution to prevent spontaneous ignition from the reaction of silver with the glycol.
- b. When solutions containing other glycols (aliphatic dihydric alcohols) are used in these conditions, testing shall be conducted to determine if the same spontaneous ignition reaction can occur as with ethylene and propylene glycol.
- c. A silver chelating agent shall be added to the solution, if ignition can occur.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.3.10 Etching Fluorocarbons

- a. The etching of fluorocarbons shall meet the requirements of SAE-AMS 2491, Surface Treatment of Polytetrafluoroethylene, Preparation for Bonding.
- b. Etched surfaces shall be processed within 24 hours or packaged per SAE-AMS 2491.
- c. Etched surfaces packaged per SAE-AMS 2491 shall be processed within 1 year.
- d. Electrical wire or cable insulated or coated with fluorocarbons shall be etched prior to potting to ensure mechanical bond strength and environmental seal.
- e. When etching of wire insulation is required to provide satisfactory bonding to potting materials, the open end of the wire shall not be exposed to the etchant.

4.2.4 Processes

4.2.4.1 Forging

- a. Because mechanical properties are optimum in the direction of material flow during forging, forging techniques shall be used that produce an internal grain-flow pattern such that the direction of flow is essentially parallel to the principal stresses, whenever possible.
- b. If forging techniques do not allow for the direction of the flow to be parallel to the principal stresses, parts shall be designed such that the weakest grain flow direction is not in line with the principal stresses.
- c. The forging pattern shall be essentially free from re-entrant and sharply folded flow lines.
- d. After the forging technique, including degree of working, is established, the first production forging shall be sectioned to show the grain-flow patterns and to determine mechanical properties at control areas.
- e. The procedure shall be repeated after any change in the forging technique.
- f. The information gained from this effort shall be utilized to redesign the forging as necessary.
- g. These data and results of tests on the redesign shall be retained and made available for review by the procuring activity.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

h. Where forgings are used in critical applications, first-article (preproduction) approval shall be obtained from the procuring authority.

i. First-article approval and the controls to be exercised in producing subsequent production forgings shall be in accordance with SAE-AMS 2375, Control of Forgings Requiring First Article Approval.

j. In addition, trim ring or protrusion specimens shall be obtained for each forging and shall be tested for required minimum mechanical properties.

k. Surface and volumetric nondestructive inspection (NDI) shall also be performed.

4.2.4.2 Castings

Castings shall meet the requirements of SAE-AMS-2175, Castings, Classification and Inspection of.

4.2.4.3 Adhesive Bonding

a. Structural adhesive bonding shall meet MSFC-SPEC-445, Adhesive Bonding, Process, and Inspection, Requirements for.

Retesting of adhesives used for production parts is not required if they are within shelf life.

b. Structural adhesive bonding processes shall be controlled to prevent contamination that would cause structural failure that could affect the safety of the mission, crew, or vehicle or affect mission success.

The sensitivity of structural adhesive bonds to contamination is of particular concern.

(1) Bond sensitivity studies shall be conducted to verify that the required adhesive properties are maintained after exposure to potential contaminant species and concentrations.

(2) Adequate in-process cleanliness inspections shall be conducted as part of the bonding process.

c. Bonded primary structural joints shall demonstrate cohesive failure modes in shear.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.4.4 Welding

- a. The design selection of parent materials and weld methods shall be based on consideration of the weldments, including adjacent heat-affected zones, as they affect operational capability of the parts concerned.
- b. Welding procedures shall be selected to provide the required weld quality, minimum weld energy input, and protection of the heated metal from contamination.
- c. The suitability of the equipment, processes, welding supplies, and supplementary treatments selected shall be demonstrated through qualification testing of welded specimens representing the materials and joint configuration of production parts.
- d. The processing and quality assurance requirements for manual, automatic, and semiautomatic welding for space flight applications shall meet the requirements of NASA-STD-5006, General Fusion Welding Requirements for Aerospace Materials Used in Flight Hardware.

These welding processes include, but are not limited to, arc welding, solid state welding, resistance welding, and high energy density welding.

4.2.4.5 Brazing

- a. Brazing shall be conducted in accordance with AWS C-3.3, Design, Manufacture, and Examination of Critical Brazed Components, Recommended Practices for.
- b. Brazing of aluminum alloys shall meet the requirements of AWS C-3.7M/C3.7, Specification for Aluminum Brazing.
- c. Torch, induction, and furnace brazing shall meet the requirements of AWS C-3.4, Specification for Torch Brazing; AWS C-3.5, Specification for Induction Brazing; and AWS C-3.6, Specification for Furnace Brazing, respectively.
- d. Subsequent fusion-welding operations in the vicinity of brazed joints or other operations involving high temperatures that might affect the brazed joint shall be prohibited unless it can be demonstrated that the fixturing, processes, methods, and/or procedures employed will preclude degradation of the brazed joint.
- e. Brazed joints shall be designed for shear loading and not be relied upon for strength in axial loading for structural parts.
- f. The shear strength of brazed joints shall be evaluated in accordance with AWS C3.2M/C3.2, Standard Method for Evaluating the Strength of Brazed Joints.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

g. For furnace brazing of complex configurations, such as heat exchangers and cold plates, destructive testing shall be conducted on pre-production brazed joints to verify that the braze layer that extends beyond the fillet area is continuous and forms a uniform phase.

4.2.4.6 Structural Soldering

Soldering shall not be used for structural applications.

4.2.4.7 Electrical Discharge Machining and Laser Machining

a. Electrical-discharge machining (EDM) and laser machining (LM) processes shall be controlled to limit the depth of the oxide layer, the recast layer, and the heat-affected zone.

(1) The oxide layer shall be removed from the surface.

(2) In addition, the recast layer and the heat-affected zone shall be removed from bearing, wear, fatigue or fracture-critical surfaces, and from crack- or notch-sensitive materials.

The recast layer and heat-affected zone may be left on a part if an engineering evaluation shows that they are not of consequence to the required performance of the part.

b. EDM/LM schedules shall be qualified to determine the maximum thickness of the affected layers when the depth of the affected material must be known for removal or analysis.

4.2.5 Material Nondestructive Inspection (NDI)

4.2.5.1 Nondestructive Evaluation (NDE) Plan

a. The NDE Plan shall address the process for establishment, implementation, execution, and control of NDE through design, manufacturing, operations, and maintenance of flight hardware.

b. The plan shall meet the intent of MIL-HDBK-6870, Inspection Program Requirements, Nondestructive for Aircraft and Missile Materials and Parts, and the requirements of NASA-STD-5009, Nondestructive Evaluation Requirements for Fracture-Critical Metallic Components.

In case of conflict between the requirements of the two standards, the requirements of NASA-STD-5009 are applicable.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

c. Qualification and certification of personnel involved in nondestructive testing shall comply with NAS 410, NAS Certification and Qualification of Nondestructive Test Personnel.

4.2.5.2 NDE Etching

a. All metallic fracture-critical parts shall be NDE etched prior to fluorescent dye-penetrant inspection.

b. All machined or otherwise mechanically disturbed surfaces that are to be penetrant inspected shall be adequately etched to assure removal of smeared, masking material prior to penetrant application on fracture-critical parts.

4.2.5.3 Nickel Plating

a. Electrodeposited nickel plating shall be applied according to the requirements of SAE-AMS 2403 (general purpose nickel plating) or SAE-AMS 2423 (nickel hard coat).

b. Electroless nickel plate shall be applied per SAE-AMS 2404.

c. The nickel-aluminum interface in nickel-plated aluminum shall be protected from exposure to corrosive environments.

Nickel and aluminum form a strong galvanic cell at the nickel-aluminum interface, and exposure of the aluminum alloy to a corrosive environment can produce rapid disbonding of the nickel plate.

4.2.6 Special Materials Requirements

4.2.6.1 Residual Stresses

Residual tensile stresses are induced into manufactured parts as a result of forging, machining, heat treating, welding, special metal-removal processes, or the straightening of warped parts. Residual stresses may be harmful in structural applications when the part is subjected to fatigue loading, operation stresses, or corrosive environments.

a. Residual stresses shall be controlled or minimized during the fabrication sequence by special treatments such as annealing and stress relieving.

b. When residual stresses do remain in structural or stress-corrosion-sensitive hardware, they shall be accounted for in structural analyses and corrosion/stress-corrosion assessments.

Residual stresses should be quantified by an appropriate technique (such as x-ray diffraction).

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

c. The use of stress equalization in concert with the straightening of warped parts shall require an approved MUA.

4.2.6.2 Sandwich Assemblies

a. Sandwich assemblies shall be designed to prevent the entrance and entrapment of water vapor or other contaminants into the core structure.

b. Honeycomb sandwich assemblies that will be subjected to heating shall use a metallic or glass-reinforced core to minimize the absorption of moisture.

c. Perforated and moisture-absorbing cores shall not be used in sandwich assemblies.

d. Test methods for sandwich constructions and core materials shall meet the requirements of SAE-AMS-STD-401, Sandwich Constructions and Core Materials: General Test Methods.

4.2.6.3 Corrosion Prevention and Control

a. All parts, assemblies, and equipment, including spares, shall be finished to provide protection from corrosion in accordance with the requirements of MSFC-SPEC-250, Protective Finishes for Space Vehicle Structures and Associated Flight Equipment, General Specification for.

b. Corrosion control of galvanic couples shall be in accordance with MIL-STD-889, Dissimilar Metals.

c. Galvanic couples for alloy combinations not listed in MIL-STD-889 shall not exceed 0.25 volts.

d. The following additional requirements shall be implemented for human-rated spacecraft hardware:

- (1) Faying surfaces of metal alloys shall be sealed for Classes I, II, & III protective finish classes.
- (2) All contacts between graphite-based composites and metallic materials shall be treated as dissimilar metal couples and sealed per MSFC-SPEC-250.
- (3) All electrical bonding connections shall be faying-surface sealed, except for nickel-plated surfaces utilized in Class III applications.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

For hardware in the mild corrosive environment of standard habitable spacecraft volumes where condensation is precluded, the following changes may be made:

Exposed aluminum surfaces may have anodic coatings instead of the organic coatings specified in MSFC-SPEC-250. Conversion coatings may be used as the sole corrosion protection for 5000 and 6000 series corrosion-resistant aluminum alloys. They are not acceptable as the sole corrosion protection for 2000 and 7000 series aluminum alloys.

e. For human-rated spacecraft hardware, corrosion prevention and control techniques shall be implemented to protect the hardware from corrosion as a result of exposure to manufacturing, storage, installation, and service environments.

- (1) These techniques shall include the application of engineering design and analysis, quality assurance, NDI, manufacturing, operations, and support technologies used to prevent the initiation of corrosion, avoid functional impairment due to corrosion, and provide processes for the tracking and repair of corrosion.
- (2) Specific corrosion prevention and control techniques shall be defined in the Materials and Processes Selection, Control, and Implementation Plan.

4.2.6.3.1 Passivation

Corrosion-resistant steels shall be passivated after machining.

4.2.6.3.2 Sealing

Removable panels and access doors in exterior or interior corrosive environments shall be sealed either by mechanical seals or by separable, faying-surface sealing.

4.2.6.4 Hydrogen Embrittlement

a. When designing liquid or gaseous hydrogen systems, the degradation of metallic materials properties by hydrogen embrittlement shall be addressed in the Materials and Processes Selection, Control, and Implementation Plan.

Overall, hydrogen embrittlement of materials is not very well understood, and there are only limited materials property data generated and reported in MAPTIS.

b. An MUA shall be written rationalizing the selection of metallic materials to preclude cracking and to ensure system reliability and safety.

Test data may have to be generated in a simulated environment to support the rationale.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Guidelines for the design of safe hydrogen systems are contained in ANSI/AIAA G-095, Guide to Safety of Hydrogen and Hydrogen Systems.

c. Electrochemical processes or exposure to acids or bases during manufacturing or processing shall be controlled to prevent hydrogen embrittlement, or embrittlement relief treatment shall be performed promptly after processing (see section 4.2.2.2.1).

Hydrogen embrittlement of metallic materials can also be caused by electrochemical processes or exposure to acids or bases during manufacturing or processing.

4.2.6.5 Fastener Installation

a. Self-locking fastener reuse shall be allowed when the running torque prior to clamp-up remains between the maximum self-locking torque and the minimum breakaway torque.

b. Fasteners shall be wet installed when exposed to aqueous corrosive environments and/or applications where condensation can occur.

(1) Wet installation of fasteners shall be performed using a corrosion-resistant sealant and installing the fastener while the sealant is still wet.

c. Fastener management and control policy, responsibilities, and practices for structural fasteners, fracture-critical fasteners, and safety-critical fasteners that are procured, received, tested, inventoried, or installed for space flight shall meet the requirements of NASA-STD-6008, NASA Fastener Procurement, Receiving Inspection, and Storage Practices for Spaceflight Hardware.

d. The installation of titanium fasteners and associated parts shall meet the requirements of MSFC-STD-557, Threaded Fasteners, 6 Al-4V Titanium Alloy, Usage Criteria for Spacecraft Applications.

4.2.6.5.1 Liquid Locking Compound

a. Liquid locking compounds shall not be used as secondary locking features on safety-critical fasteners².

b. Liquid locking compounds used as a secondary locking feature in non-safety-critical applications shall require a validated process specified on the engineering drawing.

² For the purposes of this requirement, “safety-critical” fasteners are defined as

- (a) All primary or secondary structural fasteners used in the exterior and interior of flight modules.
- (b) All non-structural fasteners used exterior to flight modules, which may pose a FOD risk to vehicle operations and which have not been vibration tested during qualification or acceptance of the hardware.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

4.2.6.5.2 Silver-Plated Fasteners

Silver reacts rapidly with atomic oxygen to generate a loose, friable, black oxide that can cause contamination and affect the operation of mechanisms.

Silver-plated fasteners shall not be used in external applications where the silver plating is directly exposed to atomic oxygen.

4.2.6.6 Contamination Control

- a. A contamination control plan shall be generated in accordance with the guidelines of ASTM E1548, Standard Practice for Preparation of Aerospace Contamination Control Plans.
- b. The contamination control plan shall include controls on contamination-sensitive manufacturing processes such as adhesive bonding, controls on packaging for shipment and storage, and a foreign-object-debris (FOD) prevention program.
- c. The FOD prevention program shall be established for all ground operations of mechanical and electrical systems of flight hardware including the design, development, manufacturing, assembly, repair, processing, testing, maintenance, operation, and check out of the equipment to ensure the highest practical level of cleanliness.
- d. The FOD prevention program shall conform to NAS 412, Foreign Object Damage/Foreign Object Debris (FOD) Prevention.
- e. Cleanliness levels for all hardware shall be identified on the engineering drawings.

4.2.6.7 Packaging

Packaging shall protect hardware from corrosion and contamination during shipping and storage.

4.3 Verification

- a. Verification of compliance with the requirements of this document shall consist of the following steps as a minimum:
 - (1) NASA approval of the contractor Materials and Processes Selection, Implementation, and Control Plan and other applicable materials data requirements documents, such as the Contamination Control Plan and NDE Plan.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- (2) Contractor M&P signature on engineering drawings to verify compliance with the requirements of this document or the Materials and Processes Selection, Implementation, and Control Plan.
- (3) NASA audits of contractor M&P activities relating to hardware design and manufacturing.
- (4) Establishment and operation of the M&P control board in accordance with section 4.1.1.5 of this standard.
- (5) NASA approval of MUAs.
- (6) NASA approval of MIULs.

NOTE: Per section 4.1.3: The use of M&P that do not comply with the technical requirements of this standard may be acceptable in the actual hardware applications. MUAs shall be submitted for all M&P that are technically acceptable but do not meet the technical requirements of this standard, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan.

APPENDIX B

CATEGORY III MUA RATIONALE CODES

FLAMMABILITY RATIONALE CODES

CODE	RATIONALE
101	Approved Materials Usage Agreement (MUA) Category I.
102	Approved Materials Usage Agreement (MUA) Category II.
103	Materials passed requirements when tested in configuration.
104	Unexposed, overcoated, or sandwiched between nonflammable materials and no ignition source or propagation path.
105	Minor usage (less than 45 g (0.1 lb) mass and 13 cm ² (2 in ²) surface area); no propagation path or ignition source.
106	Material is used in hermetically sealed container.
107	Passes test No. 10 of NASA-STD-(I)-6001, Flammability Test for Materials in Vented Containers, by test or analysis.
108	Off-the-shelf equipment having material acceptable in configuration; no ignition source or propagation path.
109	Material not exposed; totally immersed in fluid; evaluated for fluid compatibility only.
110	Material is acceptable when used on a metal substrate that provides a good heat sink. Material considered noncombustible in this configuration by test or analysis.
111	Material is flammable but is sandwiched between nonflammable materials with edges only exposed and is more than 5 cm (2 in) from an ignition source or more than 30 cm (12 in) from other flammable materials.
112	Material is flammable but is unexposed or is overcoated with a nonflammable material.
113	Material is flammable but has a thickness <u>less than</u> 0.25 mm (0.010 in) and is sprayed or bonded to a metallic surface greater than 1.6 mm (0.062 in) thick.
114	Material is flammable but is used in “small amounts” and is more than 5 cm (2 in) from an ignition source or more than 30.5 cm (12 in) from other flammable materials. “Small amounts” for flammability may be quantified as follows: total weight less than 45 g (0.1 lb) and less than 13 cm ² (2.0 in ²) surface area.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

TOXICITY (OFFGASSING) RATIONALE CODES

CODE	RATIONALE
201	Approved Material Usage Agreement (MUA) Category I.
202	Meets toxicity requirements with performed cure.
203	T value for material/component in usage weight is <0.5 for manned flight compartment volume.
204	Materials usage in hermetically sealed container.

FLUID SYSTEM COMPATIBILITY RATIONALE CODES

CODE	RATIONALE
301	Approved Material Usage Agreement (MUA) Category I.
302	Passes requirements in configuration.
303	Material is B-rated in MAPTIS (batch/lot testing required) but batch/lot used in hardware passed test.
304	Approved Material Usage Agreement (MUA) Category II.

THERMAL VACUUM STABILITY RATIONALE CODES

CODE	RATIONALE
401	Approved Material Usage Agreement (MUA) Category I.
402	Approved Material Usage Agreement (MUA) Category II.
403	VCM between 0.1 and 1.0 percent; exposed area is less than 13 cm ² (2 in ²) and not near a critical surface.
404	VCM >1.0 percent; exposed area is less than 1.6 cm ² (0.25 in ²).
405	Unexposed, overcoated, or encapsulated with approved material.
406	Material is B-rated in MAPTIS (batch/lot testing required) but batch/lot used in hardware cured to meet requirements.
407	Meets thermal vacuum stability requirements in configuration.
408	Materials usage in hermetically sealed container.
409	Material has VCM >0.1 percent but is enclosed in a sealed container (maximum leak rate less than 1 x 10 ⁻⁴ cm ³ /sec).

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

STRESS CORROSION CRACKING RATIONALE CODES

CODE	RATIONALE
501	Approved Material Usage Agreement (MUA) Category I.
502	Approved Material Usage Agreement (MUA) Category II.
503	Maximum tensile stress <50% of yield strength for part on electrical/electronic assemblies.
504	Martensitic or PH stainless steels used in ball bearing, race, or similar applications where the primary loading is compressive.
505	Metal not listed in table 1 of MSFC-STD-3029 for stress corrosion cracking is not exposed to a corrosive environment after final assembly through end-item use.
506	Carbon and low alloy high strength steels greater than 1240 MPa (180 ksi) used in ball bearings, springs, or similar applications where primary loading is compressive, low tensile stresses, or history of satisfactory performance.

CORROSION RATIONALE CODES

CODE	RATIONALE
601	Approved Material Usage Agreement (MUA) Category I.
602	Approved Material Usage Agreement (MUA) Category II.
603	Adequately finished for corrosion protection.
604	Acceptable in use environment.
606	Electrical grounding required, cladding plus conversion coating adequate.
607	Thermal conductance and electrical bonding requirements preclude painting. Conversion coating is adequate (for aluminum only).
608	Finished on a higher assembly.
609	Laminated shim - minimum exposure of corrosion resistant material.
610	Material does not meet the requirements of MSFC-SPEC-250, Class II, but is treated or coated in a manner which meets or exceeds the requirements of MSFC-SPEC-250. Actual surface treatment shall be listed.
611	Material does not meet the requirements of MSFC-SPEC-250, Class II, but is not exposed to a corrosive environment after final assembly through end-item use.
612	Welding of titanium alloy-to-alloy or commercially pure-to-alloy using commercially pure filler metal in mixed alloy welds where hydrogen embrittlement is not predicted in service.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

GENERAL CODES

CODE	RATIONALE
702	Generic materials controlled by military or industry specification using MAPTIS averages for ratings or test results. Material codes for generic material shall be used.
703	Military specification or industry specification allowing several material options where all options have acceptable ratings.

**APPENDIX C
RECOMMENDED DATA REQUIREMENTS DOCUMENTS**

Recommended Data Requirements Documents (DRDs) are as follows:

- Materials and Processes Selection, Implementation, and Control Plan.
- Material Usage Agreements (MUA).
- Materials and Processes Identification and Usage List (MIUL).
- Contamination Control Plan (CCP).
- Nondestructive Evaluation Plan (NDE).

Examples of DRD content are provided on the following pages. However, the specific DRDs and the content of those DRDs should be tailored to each spacecraft program, and additional DRDs may be appropriate.

NASA-STD-6016

DATA REQUIREMENTS DESCRIPTION (DRD)

1. **PROGRAM:**
2. **DRD NO.:** XXXX
3. **DATA TYPE:** 1
4. **DATE REVISED:**
5. **PAGE:** 1
6. **TITLE:** Materials and Processes Selection, Control, and Implementation Plan
7. **DESCRIPTION/USE:**

This plan shall document the degree of conformance and method of implementation for each requirement in this standard, identifying applicable in-house specifications used to comply with the requirement. It shall also describe the methods used to control compliance with these requirements by subcontractors and vendors. The Materials and Processes Selection, Control, and Implementation Plan, upon approval by the procuring activity, shall become the Materials and Processes implementation document used for verification.
8. **DISTRIBUTION:** As determined by the Contracting Officer.
9. **INITIAL SUBMISSION:** SRR
10. **SUBMISSION FREQUENCY:** Final at SDR
11. **REMARKS:**
12. **INTERRELATIONSHIP:** Parent SOW Paragraph: XXXX
13. **DATA PREPARATION INFORMATION:**
- 13.1 **SCOPE:**

The Materials and Processes Selection, Control, and Implementation Plan shall describe the hardware developer's activities involved in the identification, evaluation, documentation, and reporting of materials and processes usage in space flight hardware, support hardware, and ground support equipment.
- 13.2 **APPLICABLE DOCUMENTS:**

NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft
- 13.3 **CONTENTS:**

The necessary interfaces with procuring activity in the operation of this plan shall be defined. The method for materials control and verification of subcontractors and vendors shall be included in the hardware developer's plan. As a minimum and as applicable, the plan shall address the following:

Conformance – The Plan shall address each applicable paragraph of NASA-STD-6016 and describe the method of implementation and degree of conformance for each applicable requirement. If tailoring of the requirements is planned or necessary, alternate approaches to NASA-STD-6016 may be submitted in this plan, which meet or exceed the stated requirements. This tailoring approach will allow for NASA approval of alternate requirements.

Hardware Developer's Organization - Authority shall be assigned to an individual or group who shall be responsible for review and approval of all M&P specified prior to release of engineering documentation.

Materials and Processes Identification - Identification and documentation of the M&P used, both in the original design and in any changes, shall be contained in the Material and Process Identification and Usage List DRD.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

Testing - Logic, procedures and data documentation for any proposed test program to support materials screening and verification testing. Any material/process testing to be performed by the hardware developer shall require prior NASA approval.

Materials Usage Agreement (MUA) Procedures - Logic, procedures and documentation involved in documenting and approving materials/processes as indicated in NASA-STD-6016 shall be defined, including those that do not meet the established requirements, but are proposed for use due to lack of replacement materials/processes or other considerations and shall be contained in the Materials Usage Agreement DRD.

Material Design Properties – The plan shall contain the philosophy describing how material properties will be determined, and if those properties do not exist, how the material properties will be developed including, but not limited to the statistical approaches to be employed.

Process Controls – The plan shall identify all process specifications used to implement specific requirements in NASA-STD-6016. All materials processes used in manufacturing shall be documented in process specifications and all applicable process specifications shall be identified on the engineering drawing. Each processing step in the process specification shall be identified in a level of detail that ensures the process is repeatable.

- 13.4 **FORMAT**: Electronic, Word[®]-compatible document or Adobe[®] PDF. For each paragraph in section 4 of NASA-STD-6016, the plan shall state the requirement from NASA-STD-6016, identify the degree of conformance under the subheading “Degree of Conformance,” and identify the method of implementation under the subheading “Method of Implementation.”
- 13.5 **MAINTENANCE**: Contractor-proposed changes to document shall be submitted to NASA for approval. Complete re-issue of the document is required.

NASA-STD-6016

DATA REQUIREMENTS DESCRIPTION (DRD)

1. **PROGRAM:**
2. **DRD NO.:** XXXX
3. **DATA TYPE:** 1 (Category I and II MUAs)
2 (Category III MUAs)
4. **DATE REVISED:**
5. **PAGE:** 1
6. **TITLE:** Materials Usage Agreements (MUA)
7. **DESCRIPTION/USE:**

MUAs shall be submitted for all materials and processes that are technically acceptable but do not meet the technical requirements of NASA-STD-6016, as implemented by the approved Materials and Processes Selection, Control, and Implementation Plan. [The use of materials and processes that do not comply with the technical requirements of this standard may be technically acceptable if hardware reliability and vehicle safety are not affected.]
8. **DISTRIBUTION:** As determined by the Contracting Officer.
9. **INITIAL SUBMISSION:** PDR.
10. **SUBMISSION FREQUENCY:** At PDR and as the need for new MUAs is identified during the detailed design process. MUAs shall be revised and resubmitted whenever design modifications affect the part numbers identified on the MUA or the MUA rationale.
11. **REMARKS:**
12. **INTERRELATIONSHIP:** Parent SOW Paragraph: XXXX
13. **DATA PREPARATION INFORMATION:**
- 13.1 **SCOPE:**

MUAs shall be submitted as described below.

Category I MUAs – Category I MUAs are those that involve material/processes usage that could affect the safety of the mission, crew, or vehicle or affect the mission success, but **must** be used for functional reasons. Approval by the responsible NASA Materials and Processes organization and the NASA Program/Project Office shall be required.

Category II MUAs - Category II MUAs are those that involve material/processes usage that fails a screening of Material and Processes requirements and is not considered a hazard in its use application but for which no Category III rationale code exists. Approval by the responsible NASA Materials and Processes organization shall be required.

Category III MUAs - Category III MUAs are those that involve materials or processes that have not been shown to meet these requirements but have an approved rationale code listed in Appendix B of NASA-STD-6016. They are evaluated and determined to be acceptable at the configuration/part level. Category III MUAs shall be reported in the Materials Identification and Usage List (MIUL) system or electronic data system utilizing the approved rationale codes in Appendix B. A key may be provided to correlate contractor Category III MUA database codes to the codes in Appendix B. No MUA form is submitted. [Category III MUAs are identified here for completeness, but are not required until after PDR.]

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- 13.2 **APPLICABLE DOCUMENTS:**
NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft
MSFC-STD-3029, Guidelines for the Selection of Metallic Materials for Stress Corrosion Cracking Resistance in Sodium Chloride Environments
- 13.3 **CONTENTS:**
The MUA package shall include all technical information required to justify the application. MUAs for stress corrosion shall include a Stress Corrosion Cracking Evaluation Form per MSFC-STD-3029 (see NASA-STD-6016) and a stress analysis.
- 13.4 **FORMAT:** Electronic. A sample MUA form is provided in NASA-STD-6016; however, Contractor format is acceptable. The complete MUA package shall be provided in Adobe® PDF format; the MUA form shall also be provided in a format that is compatible with the NASA Materials and Processes Technical Information System (MAPTIS) database.
- 13.5 **MAINTENANCE:** Contractor updates to the Category I and Category II MUAs shall be submitted to NASA for approval. Complete re-issue of the MUA is required.

NASA-STD-6016

DATA REQUIREMENTS DESCRIPTION (DRD)

1. **PROGRAM:**
2. **DRD NO.:** XXXX
3. **DATA TYPE:** 2
4. **DATE REVISED:**
5. **PAGE:** 1
6. **TITLE:** Materials Identification and Usage List (MIUL)
7. **DESCRIPTION/USE:**

The MIUL is an electronic searchable parts list or separate electronic searchable materials identification and usage list. The MIUL identifies all Materials and Processes (M&P) usages contained in the end item, excluding piece part electronics, for evaluation of the acceptability of M&P selected and utilized.
8. **DISTRIBUTION:** As determined by the Contracting Officer.
9. **INITIAL SUBMISSION:** PDR
10. **SUBMISSION FREQUENCY:** As-designed MIUL – at Hardware Acceptance Review
As-built MIUL updates – prior to FRR
11. **REMARKS:**
12. **INTERRELATIONSHIP:** Parent SOW Paragraph: XXXX
13. **DATA PREPARATION INFORMATION:**
 - 13.1 **SCOPE:**

Materials and processes usage shall be documented in an electronic searchable parts list or separate electronic searchable Materials Identification and Usage List (MIUL). The procedures and formats for documentation of materials and processes usage will depend upon specific hardware but shall cover the final design. The system used shall be an integral part of the engineering configuration control/release system. A copy of the stored data shall be provided to NASA in a form compatible with the Materials and Processes Technical Information System (MAPTIS).
 - 13.2 **APPLICABLE DOCUMENTS:**

NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft
 - 13.3 **CONTENTS:**

The parts list or MIUL shall identify the following applicable information:

 - Detail drawing and dash number
 - Next assembly and dash number
 - Change letter designation
 - Drawing source
 - Material form
 - Material manufacturer
 - Material manufacturer's designation
 - Material specification
 - Process specification
 - Environment
 - Weight (nonmetallic materials)
 - MAPTIS Material code (if data are to be provided in a form compatible with MAPTIS)
 - Standard/commercial part number
 - Contractor
 - System

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- Subsystem
- Maximum operating temperature
- Minimum operating temperature
- Fluid type
- Surface area (nonmetallic materials)
- Associate contractor number
- Project
- Document title
- Criticality
- Line number
- Overall evaluation
- Overall configuration test
- Maximum operating pressure
- Minimum operating pressure
- MUA number or rationale code
- Cure codes
- Materials rating
- Remarks (comments field)

- 13.4 **FORMAT**: Contractor format is acceptable. However, Contractor format for electronic submittal of MIUL data shall be compatible with the NASA Materials and Processes Technical Information System (MAPTIS) database.
- 13.5 **MAINTENANCE**: Contractor updates to the MIUL shall be submitted to NASA for approval. Complete re-issue of the document is not required.

NASA-STD-6016

DATA REQUIREMENTS DESCRIPTION (DRD)

1. **PROGRAM:**
2. **DRD NO.:** XXXX
3. **DATA TYPE:** 2
4. **DATE REVISED:**
5. **PAGE:** 1
6. **TITLE:** Contamination Control Plan (CCP)
7. **DESCRIPTION/USE:**

The contamination control plan defines implementation measures to control contamination of flight hardware and fluid systems during manufacturing, assembly, test, transportation, launch site processing, and post-flight refurbishment.
8. **DISTRIBUTION:** As determined by the Contracting Officer.
9. **INITIAL SUBMISSION:** PDR
10. **SUBMISSION FREQUENCY:** The contractor may submit updates/revisions at any time. Final submission shall be at CDR.
11. **REMARKS:**
12. **INTERRELATIONSHIP:** Parent SOW Paragraph: XXXX
13. **DATA PREPARATION INFORMATION:**
 - 13.1 **SCOPE:**

The contamination control plan shall be generated in accordance with the guidelines of ASTM E1548, Standard Practice for Preparation of Aerospace Contamination Control Plans (as specified by NASA-STD-6016) and shall include:

 - a. A FOD control plan to prevent damage to flight hardware and injury to the flight crew by foreign object debris (FOD) during manufacture, assembly, test, transportation, launch site processing, operation, repair, modification, refurbishment, and maintenance. The FOD prevention program shall conform to NAS 412, Foreign Object Damage/Foreign Object Debris (FOD) Prevention, as specified by NASA-STD-6016.
 - b. Definition of cleanliness level acceptance limits and verification methods for fluid systems, and for general flight hardware internal and external surfaces. The plan shall also contain a list identifying all system fluids, together with the fluid specifications (for procurement or custom mixing) and the required cleanliness levels for the fluid system.
 - 13.2 **APPLICABLE DOCUMENTS:**

NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft
NAS 412, Foreign Object Damage/Foreign Object Debris (FOD) Prevention
 - 13.3 **CONTENTS:**

The FOD control plan shall address the following elements:

 - a. Identification of probable FOD sources.
 - b. Early design considerations for FOD prevention, resistance to damage, foreign object entrapment, etc.
 - c. Manufacturing planning for minimizing FOD generation and cleaning up whatever FOD is generated.
 - d. FOD control methods.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

- e. FOD Awareness and Prevention Training.
- f. Metrics - Measuring techniques for analysis, trending, and feedback.
- g. Incident investigation/reporting, "lessons learned."
- h. Awareness/Employee Feedback.

The contractor shall define cleanliness level acceptance limits and verification methods for fluid systems, and for general flight hardware internal and external surfaces. The contractor shall also provide a list identifying all system fluids, together with the fluid specifications (for procurement or custom mixing) and the required cleanliness levels for the fluid system.

13.4 **FORMAT**: Electronic, Word[®]-compatible document or Adobe[®] PDF.

13.5 **MAINTENANCE**:

DATA REQUIREMENTS DESCRIPTION (DRD)

- | | | | | |
|----|--|----|----------------------|------|
| 1. | PROGRAM: | 2. | DRD NO.: | XXXX |
| 3. | DATA TYPE: | 4. | DATE REVISED: | |
| 6. | TITLE: Nondestructive Evaluation Plan | 5. | PAGE: | 1 |

7. **DESCRIPTION/USE:**

The Nondestructive Evaluation (NDE) plan shall address the NDE requirements necessary to assure the health and integrity of the flight hardware throughout its life cycle. This plan shall identify all Nondestructive Evaluation (NDE) standards employed in the inspection of materials.

8. **DISTRIBUTION:** As determined by the Contracting Officer.

9. **INITIAL SUBMISSION:** PDR

10. **SUBMISSION FREQUENCY:** The contractor may submit updates/revisions at any time.

11. **REMARKS:**

12. **INTERRELATIONSHIP:**

13. **DATA PREPARATION INFORMATION:**

SCOPE:

The NDE Plan shall address the process for establishment, implementation, execution, and control of NDE. The plan shall meet the intent of MIL-HDBK-6870A, Inspection Program Requirements, Nondestructive for Aircraft and Missile Materials and Parts and the requirements of NASA-STD-5009, Nondestructive Evaluation Requirements for Fracture-Critical Metallic Components as specified by NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft

- 13.2 **APPLICABLE DOCUMENTS:**

NASA-STD-6016, Standard Materials and Processes Requirements for Spacecraft

MIL-HDBK-6870A: Inspection Program Requirements, Nondestructive for Aircraft and Missile Materials and Parts

NASA-STD-5009: Nondestructive Evaluation Requirements for Fracture-Critical Metallic Components

NAS 410, NAS Certification and Qualification of Nondestructive Test Personnel

- 13.3 **CONTENTS:**

NDE Specifications and Standards -- The NDE plan shall address the selection and the order of precedence of applicable government, industry, and prime contractor NDE specifications and standards and how the requirements contained therein are implemented through internal procedures and how-to documents. The oversight of subcontractor implementation and flow down of the NDE requirements shall also be addressed. The plan shall address commonly used aerospace industry NDE methods including, but not limited to, fluorescent dye penetrant, radiographic (film radiography, digital radiography, computed tomography), ultrasonic, neutron radiography, magnetic particle, eddy current, infrared thermography, and visual inspection. The plan shall address how all NDE specifications and standards will be approved by the appropriate government authority.

APPROVED FOR PUBLIC RELEASE – DISTRIBUTION IS UNLIMITED

NASA-STD-6016

NDE Requirements During Hardware Design -- The NDE plan shall address how the processes are implemented to ensure that all designs are reviewed to establish NDE inspection requirements and to ensure that the parts are inspectable. The plan shall address how the areas or zones of the part to be inspected are identified on the drawing. The plan shall address how the operations and maintenance NDE requirements will be integrated in the design of the hardware.

Part Classification -- The plan shall address appropriate flight hardware and GSE part classification in accordance with MIL-HDBK-6870A.

NDE Sensitivity Levels -- NDE sensitivity levels shall be classified as Standard NDE, Special NDE, Custom NDE, and Visual Inspection in the NDE plan. The plan shall address minimum detectable flaw size for Standard NDE for each material group of flight hardware in compliance with NASA-STD-5009 where applicable. The plan shall address procedures for defining NDE acceptance criteria for each of the sensitivity levels and identify organizations and their responsibilities in establishing NDE acceptance criteria, NDE drawing call outs, and NDE Operations and Maintenance criteria. Note: Custom sensitivity level refers to an NDE sensitivity level that is not covered under the other three NDE sensitivity levels and is applicable to non-fracture-critical parts.

NDE Acceptance Criteria -- The plan shall address how NDE acceptance criteria are determined and implemented for each sensitivity level. For flight hardware, the plan shall require rejection of any crack-like flaw irrespective of the sensitivity level of the inspection. The plan shall address how significant flaw indications, irrespective of the acceptance criteria, will be dispositioned.

NDE During Manufacturing --The plan shall address establishment of minimum NDE acceptance requirements in terms of NDE sensitivity level, methods of inspection (fluorescent dye penetrant, ultrasonic, etc.), sampling frequency, and NDE inspection coverage (e.g., 100% surface area or selected area) for manufactured hardware as grouped by classification of the part, material type, and form. The NDE plan shall address how NDE is sequenced such that inspection reliability is optimized by performing NDE before manufacturing processes that may significantly reduce flaw detection capability. The requirements for etching of metal parts prior to penetrant inspection shall be specifically addressed in the plan.

NDE Material Compatibility -- The plan shall address compatibility of NDE materials and processes with the hardware.

Fracture-Critical Parts -- The Plan shall address how the listing of all Fracture-Critical parts, created according to the Fracture Control Plan, will be integrated with NDE requirements. The plan shall address Special NDE and Standard NDE methods in accordance with NASA-STD-5009.

NDE During Operations and Maintenance: --The NDE plan shall address the NDE requirements necessary to assure the health and integrity of the hardware throughout its life cycle. The NDE plan shall address NDE requirements during operations and maintenance of those parts that are susceptible to damage such as impact, corrosion, material degradation and wear, etc. The NDE plan shall address NDE requirements for inspecting repaired parts. The plan shall address the NDE procedures and physical standards required to perform the operations and maintenance NDE inspections.

NDE Reporting and Record Retention -- The NDE plan shall describe the NDE nonconformance reporting system, record retention, and traceability.

Process Audit -- The plan shall address periodic auditing of NDE processes at prime contractor, vendors, and subcontractors to verify compliance with the NDE requirements established in the plan.

Personnel Training -- The NDE plan shall identify formal training and certification requirements for NDE Inspection in accordance with NAS 410.
